TASK 1 REPORT

Internship Program — Batch 2026

Submitted By:	Abdullah Rafique
Department:	AI / ML
Submitted To:	Sir Moazzan, CEO M-Tech
Date:	30 June 2026

1. Introduction

This report presents the work completed for **Task 1** of the M-Tech Production & Marketing AI/ML Internship Program, Batch 2026. The internship focuses on practical exposure to core concepts in Artificial Intelligence and Machine Learning, equipping interns with skills applicable to real-world technology and marketing challenges.

M-Tech Production & Marketing is a forward-looking company based in Haripur, KPK, specializing in Technology, Training, Marketing, and Projects. The internship is structured in a 9-Phase roadmap designed to progressively build theoretical knowledge and hands-on project experience.

2. Objectives

- Understand the basics of Python programming, including printing output, using variables, and performing simple arithmetic.
- Learn how to take user input, convert between data types, and work with Python's built-in data types and string operations.
- Understand control flow in Python, including if-else conditions, nested conditions, and for/while loops with break and continue statements.

3. Task Description

Today's session covered Module 1 (Python Foundations) and Module 2 (Control Flow) from the AI/ML Lab Manual. Module 1 introduced the basics of Python: writing the first program, using variables and arithmetic, taking user input, converting between data types, and working with Python's core data types and string operations such as concatenation, indexing, slicing, and built-in string methods.

Module 2 covered control flow in Python, including simple if-else statements, if-elif-else for multiple conditions, nested if-else logic, and loops (for and while), along with loop control using break and continue.

4. Work Done

- Wrote basic Python programs using print statements, variables, and arithmetic operations.
- Practiced taking user input with input(), converting it to int and float, and reading multiple values on one line.
- Practiced string operations including concatenation, repetition, indexing, slicing, and built-in methods such as lower(), upper(), strip(), and replace().
- Wrote conditional programs using if-else, if-elif-else, and nested if-else statements to handle multiple conditions.
- Practiced for and while loops, including using break and continue to control loop execution.

Module 1:

Task 1.2 : Ss output

```
main.py  [Icons] [Run] Output
1 # Take string input from the user
2 text = input("Enter a string: ")
3
4 # Print first character
5 print("First Character:", text[0])
6
7 # Print last character
8 print("Last Character:", text[-1])
9
10 # Print length of the string
11 print("Length:", len(text))
12
13 # Print string in uppercase
14 print("Uppercase:", text.upper())
```

```
Enter a string: Abdullah Rafique
First Character: A
Last Character: e
Length: 16
Uppercase: ABDULLAH RAFIQUE

=== Code Execution Successful ===
```

```
main.py  [Icons] [Run] Output
1 # Initialize the sum
2 total = 0
3
4 # Keep asking for numbers
5 while True:
6     number = int(input("Enter a number (0 to stop): "))
7
8     # Stop if the user enters 0
9     if number == 0:
10        break
11
12    # Add the number to the total
13    total += number
14
15 # Print the final sum
16 print("Sum of all numbers entered:", total)
```

```
Enter a number (0 to stop): 10
Enter a number (0 to stop): 20
Enter a number (0 to stop): 15
Enter a number (0 to stop): 0
Sum of all numbers entered: 45

=== Code Execution Successful ===
```

Module 2: Task 2.3: Ss with output

5. Challenges Faced

Initially, it was a bit confusing to remember that `input()` always returns a string by default, leading to errors when trying to do arithmetic directly on user input without converting it to `int` or `float` first. Understanding negative indexing and slicing ranges in strings also took a few attempts to get comfortable with.

These issues were resolved by testing small code snippets individually, printing intermediate values, and reviewing the examples in the lab manual until the concepts became clear.

6. Key Learnings

- Learned the basic building blocks of Python: variables, arithmetic, user input, and type conversion.
- Became comfortable with string indexing, slicing, and common string methods used for text processing.

- Understood how to control program flow using conditional statements and loops, and how break and continue change loop behavior.

7. Conclusion

Overall, today's session built a strong foundation in core Python programming through Modules 1 and 2 of the lab manual. Practicing variables, input handling, strings, conditionals, and loops has prepared a solid base for moving on to more advanced topics such as data structures, functions, and search algorithms in upcoming sessions.
